WEEK 2 ASSIGNMENT

BUSINESS INTELLIGENCE & INTERACTIVE DASHBOARD DEVELOPMENT

Superstore Sales Performance Analysis

**Prepared by:
Hudu Yusuf Ibrahim**

Business Intelligence Overview

What is Business Intelligence?

Business Intelligence (BI) is the process of using data, analysis, and technology to help an organisation understand its performance and make better business decisions.

Why Organisations Use Dashboards

Dashboards turn large amounts of raw business data into simple, visual information that managers can understand and act on quickly. They help organisations monitor performance, identify trends and potential problems, and support faster, evidence-based decision-making.

How Dashboards Improve Decision-Making

Dashboards give managers a clear view of what is happening across the business. Instead of manually examining large spreadsheets, managers can quickly identify which regions, products, or customer segments are driving or negatively affecting performance. This allows them to respond to issues, identify opportunities, and make informed decisions before problems become more significant.

Business Objective of This Project

This project uses the Superstore Sales dataset to simulate the operations of a national retail company. The objective is to build an executive Power BI dashboard that helps senior management monitor sales performance, profitability, customer behaviour, and regional performance. The dashboard will provide meaningful insights that can support data-driven decisions on where to focus resources, reduce losses, and identify opportunities for revenue growth.
